15

WHAT IS CLAIMED IS

- 1. A single layer or laminate sheet material having a release function for a pressure-sensitive adhesive sheet, wherein the sheet material itself when it is a single layer, and at least one of the outermost layers when it is a laminate, is made from a resin material comprising a linear ethylene resin as a main component, and the resin material shows an amount of an eluted component at not more than 30°C of 3 wt% 30 wt% of the entire resin material, as measured by a Temperature Rising Elution of Fractionation method.
 - 2. The sheet material of claim 1, wherein the linear ethylene resin is a copolymer of ethylene and at least one kind of a comonomer selected from α -olefins having 3 to 12 carbon atoms.
- 3. A pressure-sensitive adhesive sheet comprising the sheet material of claim 1 or and a pressure-sensitive adhesive layer formed to be in contact with the sheet material itself when it is a single layer or when it is a laminate, at least an outermost layer thereof made from a resin material comprising a linear ethylene resin as a main component.
- 4. The pressure-sensitive adhesive sheet of claim 3, wherein the pressure-sensitive adhesive layer is formed using, as a main component, a polyester adhesive comprising aliphatic polycarbonate diol as an essential polyol component.
